

SE50AL-ML ACOUSTIC TESTS

Realized by *MAGNYTUDE* Laboratories

Measurement of noise transmission through a 1 mm metal sheet and acoustic foam (simulation of an acoustic enclosure)

Produced frequencies: From 100 up to 10,000 Hz

Measurement of noise absorption on a wall covered with acoustic foam (*standardized test*)

Produced frequencies: From 0 up to 6,400 Hz

High absorption ratio (close to 1)
=
Good absorption of initial sound by the foam (few reflections)

The acoustic tests have been made by **Magnytude** Laboratories, on behalf of **Solutions Elastomères**
